

ABSTRACT OF THE DISCLOSURE

The present invention discloses a method of receiving email by electronic communication device, which uses a mail server to connect to at least one electronic communication device via a network and store at least one notice condition. Such
5 notice condition corresponds to an electronic device; if such mail server discovers a new mail, the mail server will determine whether or not the mail matches the notice condition. If the email is determined as one matching with the notice condition, then the mail server will find out the corresponding electronic communication device according to the notice condition, and send out a notice message to the
10 corresponding electronic communication device. The notice message allows users to know that a new email is stored in the mail server.
